Note – Standard terminology is used therefore a '%' at the end of a code denotes that code plus all under it in the hierarchy. A hyphen between two codes indicates all codes between these two codes inclusive.

- Items in Red indicate codes added or changed for 2014

This specification has been designed by PRIMIS+ specifically to report uptake figures for national surveillance. Your system may utilise these + other criteria for internal audits and call / recall.

Selected guidance notes from PRIMIS+ Specification

Due to the complications around recording pregnancy, other methods should be used if practices wish to identify patients who are at risk and require vaccination. Any results should be subject to clinical review.

The concept of Immune Suppression is also a technically difficult one to represent. For many patients, especially those undergoing chemotherapy or significant radiotherapy, the indication for flu vaccination may be temporary and clinical assessment may be required.

Within the medication hierarchies, especially immune suppressant drugs there are particular problems. The concept of "immune suppression by a daily dose of 20mg prednisolone" cannot be meaningfully represented by the current system suppliers. In addition, although a drug list has been defined for immunosuppression, some may be obsolete or not given in Primary Care, so not detected by system searches.

(SCIMP note. Where patients are identified as requiring Flu vaccination because of the above, suggest entering the code :-

2J30. Patient immunocompromised

This will ensure the patient is detected for surveillance and payment searches purposes.) There is also a new Read code introduced into the PRIMIS list that may be considered :- **2J31. Patient immunosuppressed**

PREGNANCY OR DELIVERY codes

This code group contains pregnancy ,delivery, miscarriage and termination Read codes. A presence of one of these codes indicates that the patient has been, or is currently pregnant. Monitoring for seasonal vaccination will initially look for a code recorded between 1.1.14 and 31.8.14 to identify those that could be pregnant on 31.8.14. A proxy eight month period has been used before the Start date of 1st September 2014. This assumes that the first entry of any pregnancy code is likely to be entered, at the earliest, when the patient is at least four weeks pregnant. This is then checked for those where the most recent code is a 'pregnant' code as in second list below to determine if patient is still pregnant on 31.8.14. If the latest code from the first list below is in the second list, the patient is considered still pregnant. NOTE – there is a known risk that if a 'pregnant' code is inputted with the same date as a 'delivery' code (eg, for miscarriage) the patient will show as still pregnant. This should affect very small numbers. The computer search logic will be reviewed for next year
