Codes for Reporting Influenza Immunisation Uptake v 1.1 26 September 2018

A SCIMP document derived from PRIMIS Specifications V10.2 (adult) 9 Aug 18 and v3.0 (children) 21 Aug 18

There are two significant changes in the 'flu' vaccination campaign this year

- the introduction of three different injectable vaccines to be given to different cohorts.
- the transition from Read to SNOMED CT as the underlying coding system.

Read & SNOMED

SNOMED CT is becoming the preferred coding terminology for our systems. However, the transition from Read to SNOMED CT is being handled by system suppliers 'under the bonnet'. It still appears to users that Read is the only coding system in use. For this reason the rest of this document refers only to Read codes even though the documents upon which it is based now use SNOMED CT codes, with the mapped Read codes relegated to an Annex.

Different Vaccines

The implementation of three distinct injectable vaccine types may cause difficulties in the practical administration of vaccine clinics but should have little effect in how vaccinations are recorded. There are no codes specific to trivalent, quadrivalent or adjuvated vaccines.

It will be appropriate to record manufacturer, batch number & expiry date in the text associated with the 'vaccine administered' code as usual. This will suffice to identify exactly which vaccine was given should the need arise. There is no plan to record uptake by vaccine type in Scotland.

There may be cases where vaccines are prescribed instead of being administered under a PGD, in which case they are selected from a dm+d compliant picking list as in previous years.

So despite these changes the coding of 'flu' vaccination remains basically unaltered from 2017/18

Notes on Use:

- Standard terminology is used. A '%' at the end of a code denotes that code plus all under it in the hierarchy. A hyphen between two codes indicates all codes between these two codes inclusive.
- There are no new codes for 2018/19
- This specification has been designed by PRIMIS+ specifically to report uptake figures for national surveillance. It is not a recall or payment specification. Practice systems may use different codes and therefore give different results for internal audits and call / recall.

Selected guidance from PRIMIS

Identifying patients who are pregnant or immunosuppressed from the multitude of codes that may be used poses particular problems.

If practices wish to rationalise their coding to ensure accurate identification and reporting then the use of Read v2 codes from the list at Annex A is recommended.

Pregnancy

Due to the complications around recording pregnancy, other methods should be used if practices wish to identify patients who are at risk and require vaccination. Any results should be subject to clinical review to avoid calling patients inappropriately.

Immune Suppression

The concept of immune suppression is technically difficult to represent.

- For many patients, especially those undergoing chemotherapy or significant radiotherapy, the indication for flu vaccination may be temporary and clinical assessment may be required.
- The concept of "immune suppression by a daily dose of 20mg Prednisolone" cannot be meaningfully represented by the current system suppliers.
- Although a drug list has been defined for immunosuppression, some may be obsolete or not given in Primary Care and so not be detected by system searches.

Vaccination codes

Use of any of these codes on or after 1 Sep 18 indicates that a seasonal influenza vaccination has been given

Note that although all the available vaccines are represented in dm+d some of the newer vaccines do not have a Read code and system suppliers may not have made them all available through their prescribing databases.

At Risk Group - Pregnancy

The first list contains pregnancy, postnatal and termination Read codes that indicate that the patient has been, or is, pregnant. A proxy eight month period is used before the Start Date of 1 Sep 2018 (the assumption is that the first entry of any pregnancy code will be, at the earliest, when the patient is at least four weeks pregnant).

The second list contains pregnancy and antenatal codes. If the latest of all the codes is from the second list on 1 Sep 2018, the patient is considered still pregnant on 31 Aug 2018.
